Basket TP & SL in \$
 Pretty much the same with one pair trading. The difference is IT IS BASKET. If you took 10 trades and it reaches your basket TP, it will close with your expected basket TP. If one of the pair is losing, but the basket TP already reached it will close the basket anyway. Same goes to Basket SL.

imagine this. You are trading single pair. You already at profit 100 pips unrealized profit. You put in 10 pips trailing stop in your terminal. That means you already locked 90 pips profit.

Same goes here, but it is a basket. We count them in money \$\$\$. At profit \$10, i lock \$2. At profit 20, i lock 10. Same goes to others.

this only applicable if you want to put individual sl/tp
